Perfect. 🎯

You are successfully logged into **GitHub (heliosfi)**.

I can see:

- ✅ GitHub account active
- ✅ Chrome working
- ✅ ChatGPT Desktop installed
- ✅ Windows updated
- ✅ Ready to create repositories

Next Step: Create Your First Repository

Click the green button on the left:

Create repository

For the repository name, I suggest:

echoauth-core

Description:

Deterministic governance and authorization framework.

Keep:

- ✅ Public (or Private if you prefer)
- ✅ Add README

Then click:

Create repository

After that we'll create:

echoauth-core

ni-ai-core

sniperbot-logic

That gives you separate codebases for:

EchoAuth governance

NI-AI interpretation layer

SniperBot trading system

One More Thing

At the top of GitHub I also see the new:

Agent

Create Issue

Write Code

buttons.

That means GitHub's AI features are available on your account, which will be useful later when we connect everything with VS Code and Codex.

Create **echoauth-core** first and send me the next screenshot. 🚀
