

Wednesday, June 17, 2026

Yes. The text I gave you is mostly **folders**, but many of those folders should contain **new files**.

Right now your repository looks like:

Echoauth-core

├── architecture

├── docs

├── governance

├── patents

├── specs

├── src

└── README.md

Inside each folder, create the files listed below.

docs

Create:

docs

├── vision.md

├── roadmap.md

├── glossary.md

└── use-cases.md

architecture

Create:

architecture

├── system-overview.md

├── operational-spine.md

├── data-flow.md

└── threat-model.md

└── diagrams

Then inside diagrams:

diagrams

└── README.md

governance

Create:

governance

└── principles.md

└── authority-model.md

└── refusal-first.md

└── invariants.md

└── audit-framework.md

└── mcg-v3.md

└── ceg.md

patents

Create:

patents

└── patent-summary.md

└── claim-index.md

└── invention-disclosure.md

└── prior-art-notes.md

specs

Create:

specs

└── echoauth-spec.md

└── authorization-states.md

└── policy-engine.md

└── audit-log-spec.md

- ├── api-spec.md
- └── security-model.md

src

Inside src, create a folder named:

echoauth

Then inside that folder:

echoauth

- ├── __init__.py
- ├── main.py
- ├── auth
- ├── governance
- ├── audit
- ├── policy
- └── execution

Inside each of those folders create:

__init__.py

Example:

auth

- └── __init__.py

tests

Create:

tests

- ├── __init__.py
- └── test_placeholder.py

examples

Create:

examples

- └── basic_authorization_flow.md

For tonight, don't write content yet.

Just build the structure until your repository looks like:

Echoauth-core

|—— architecture

|—— docs

|—— governance

|—— patents

|—— specs

|—— src

|—— tests

|—— examples

|—— README.md

with all the files underneath.

Once that is done, send me a screenshot and then we'll start filling them in using your actual EchoAuth, NI-AI, MCG, CEG, PNRE, TLE, S-modules, and patent material instead of placeholder text. That is where the real project architecture begins.
