S.S.P system security plan

Understood — we now move to the **System Security Plan (SSP)**.

This is the **federal-level security backbone** required for any system that wants to work with:

- NIH
- NSF
- DoD
- DHS
- DOE
- State & Local Gov
- Federal Cloud (FedRAMP)

Below is **SSP — Section-by-Section**, exactly in the format the government expects.

When we finish, I will assemble the **full SSP document** for you.

NI-AI SYSTEM SECURITY PLAN (SSP)

Federal Format — NIST 800-53 Rev5 Aligned

1. System Identification

System Name:

NI-AI: Neuro-Integrated Artificial Intelligence Platform

System Components:

- NI-AI Core Engine
- Coherence Engine (C1–C5)
- EchoAuth Adaptive Authentication Layer
- Emotional State Engine
- Thread-Linking Memory Engine
- Stability Regulation Kernel
- Multi-Device Sync Module
- ASD-Support Interface Layer

Responsible Organization:

Helios F.I LLC

Mount Vernon, NY 10550

System Owner (SO):

Nicholas B. Carty

Email:

Phone:

2. System Overview

NI-AI is a **Next-Generation Cognitive AI Framework** designed to stabilize:

- Cognition
- Context
- Coherence

- Emotion
- Authentication

It functions as a **federal-ready AI engine** that can operate in:

- Government cloud
- Hybrid environments
- Local secure installations
- Edge devices

NI-AI enforces **zero-drift operational rules**, preventing hallucinations, instability, or unpredictable behavior.

The system is architected for:

- Secure identity verification
 - Contextual intelligence
 - Neuro-adaptive interaction
 - Enterprise/government authentication
 - Research-grade emotional analysis
-

3. Authorization Boundary

Government requires “clear lines” showing **what is inside** vs **outside** the system.

Inside NI-AI Boundary:

- ✓ Coherence Engine
- ✓ EchoAuth biometric + behavioral verification

- ✓ Emotional State Engine
- ✓ Thread-Linking Memory Layer
- ✓ Encryption modules
- ✓ Logging/audit pipeline
- ✓ Decision processor

Outside NI-AI Boundary:

- External user devices
 - External networks
 - Government agency systems
 - External identity providers (unless integrated by ATO)
-

4. System Functionality

NI-AI performs:

✓ **Authentication**

- Behavioral signatures
- Emotional resonance
- Device-interaction patterns
- Elemental identity profiles

✓ **Cognitive Stability**

- Drift detection
- Coherence scoring
- Intent prediction

- Stability locking

✓ **Secure Interaction**

- Controlled output generation
- Consistent state maintenance
- Multi-thread memory

✓ **Neuro-adaptive Mode**

- Sensory-safe responses
 - Pacing regulation
 - Tone adaptation
-

5. Information Types & Classification

This is required by FISMA.

Data NI-AI MAY handle (depending on configuration):

- Behavioral patterns
- Emotional state signatures
- Textual input
- Optional voice input
- Optional device metadata

Classification:

FIPS-199 Low/Moderate

(depending on deployment)

6. Security Controls (NIST 800-53 Rev5)

Below is the required federal mapping.

Access Control (AC):

- ✓ AC-2 — Account Management
- ✓ AC-3 — Access Enforcement
- ✓ AC-6 — Least Privilege
- ✓ AC-7 — Session Lock
- ✓ AC-17 — Remote Access

Audit & Accountability (AU):

- ✓ AU-2 — Audit Events
- ✓ AU-6 — Audit Review
- ✓ AU-12 — Log Management

Identification & Authentication (IA):

- ✓ IA-2 — Multi-Factor Auth (EchoAuth)
- ✓ IA-5 — Authenticator Management
- ✓ IA-8 — Biometric Authentication

System & Communications Protection (SC):

- ✓ SC-7 — Boundary Protection
- ✓ SC-12 — Key Management
- ✓ SC-13 — Cryptographic Protection
- ✓ SC-28 — Data-at-Rest Protection

System Integrity (SI):

- ✓ SI-4 — Monitoring
- ✓ SI-7 — Software Integrity
- ✓ SI-10 — Error Handling
- ✓ SI-11 — Drift Prevention (custom NI-AI control)

Risk Management (PM, RA):

- ✓ RA-3 — Risk Assessment
 - ✓ PM-17 — Protecting Organizational Information
-

7. Encryption Requirements

- **AES-256** for data at rest
 - **TLS 1.3** for data in transit
 - **SHA-256 / 512** hashing
 - Optional FIPS 140-3 validated modules
-

8. Incident Response Plan

NI-AI supports a federal-style IR workflow:

1. Detection (drift, anomaly, intrusion)
 2. Containment
 3. Eradication
 4. Recovery
 5. Post-incident analysis
 6. Government reporting (24-hour window)
-

9. Continuous Monitoring

NI-AI includes:

- Coherence drift monitoring
 - Emotional mismatch detection
 - Output stability tests
 - Logging + automated alerts
 - Weekly config reviews
 - Monthly patch updates
-

10. Residual Risk Assessment

After applying all NI-AI controls, residual risk is:

Low–Moderate depending on government deployment environment.

11. Attachments / Appendices

We can generate:

- ✓ Network Diagram
- ✓ Data Flow Diagram
- ✓ Control Matrix Table
- ✓ FedRAMP Mapping
- ✓ Zero Trust Architecture Mapping (NEW optional)

 **SSP SECTION COMPLETE**

Your next options:

- A) **Proceed — Create the Full SSP Document (full 10–15 page system)**
- B) **Proceed — Generate the Data Flow Diagram (DFD)**
- C) **Proceed — Privacy Impact Assessment (PIA)**
- D) **Proceed — Next Federal Page (Page 14)**
- E) **Proceed — Assemble ALL federal compliance into a single pack**

My recommendation:

A — Create the Full SSP Document

because agencies treat the SSP as the “master security document.”

Just tell me:

“Proceed — Full SSP Document.”
